Kennedy Quality Lawn Grass Seeds

FOR PERMANENT LAWNS OF PUTTING GREEN TEXTURE—HOW TO MAKE A LAWN

The ground should be thoroughly prepared; that is, the soil should be fertilized, then turned over to a depth of 6 inches and pulverized. Sow good seed (which is very essential) roll the ground and cross roll in order to press the seed firmly into the soil. The proper time to sow grass seed depends upon the latitude. In the central and eastern states seed may be sown from March 1st to the end of June. Seed may be sown in the fall, from the first part of August to the end of October. Sow, if possible, when the ground is moist. For seeding a new lawn use 150 pounds to the acre.

KENNEDY'S BENTURF

Reg. U.S. Pat. Off.

LAWN GRASS SEED MIXTURE (Bent Formula)

The popularity of golf in recent years has made comparison of lawns and putting greens an easy matter. One hardly expects his lawn to look as perfect as a putting green, but this is possible if sown with Kennedy's Benturf Lawn Grass Seed Mixture. With reasonable preparation and care excellent results have been accomplished with our Kennedy's Benturf Lawn Grass Seed Mixture which contains a large amount of Bent seed. This makes a compact, rapid growth, forming a close sward withstanding wear and tear. Lb. \$2.15, 25 lbs. \$50.00, 100 lbs. \$195.00

KENNEDY'S GREENTURF

When properly sown and cared for Greenturf will produce a beautiful green lawn the entire season. Lb. \$1.95, 25 lbs. \$45.00, 100 lbs. \$175.00

NOTE

When making a new lawn, sow only the best lawn grass seed.

KENNEDY'S KARPETURE LAWN GRASS SEED MIXTURE

This mixture is comprised of some of the quick germinating grasses as well as larger proportions of the permanent, deep rooted varieties. It has been tried in a great many sections of the country and has given excellent results where a quick cover was desired and has proven particularly adaptable for sowing on old lawns which have become shoddy and in need of renovating.

Lb. \$1.75; 25 lbs. \$38.75; 100 lbs. \$150.00

KENNEDY'S RENOVATING LAWN GRASS SEED MIXTURE

KENNEDY'S TENNIS COURT LAWN GRASS SEED MIXTURE

KENNEDY'S KWIKTURE LAWN GRASS SEED MIXTURE

Where a quick turf is desired which will remain green with a minimum of care and attention we recommend this mixture which is composed of deep rooting, strong growing grasses.

KENNEDY'S SHADETURE LAWN GRASS SEED MIXTURE

This is a mixture of extra fine grasses adapted for growing in the shade and under trees. We recommend the use of this mixture wherever other grasses, on account of shade, have failed to make a close sward.

Lb. \$2.10; 25 lbs. \$47.50; 100 lbs. \$185.00

KENNEDY'S TERRACE LAWN GRASS SEED MIXTURE

A mixture of strong, deep-rooted grasses for banks and terraces. Although the grasses are strong and deep-rooted, they will produce a fine, green velvety surface, and also prevent washing away during heavy rains.

Lb. \$1.90; 25 lbs. \$42.50; 100 lbs. \$165.00

LAWN CLOVER—Dwarf White

Very dwarf and of a spreading habit. We advise sowing White Clover separately on account of the seed being much heavier than that of the finer grass seed. It has a tendency to work to the bottom of the receptacle it is being sown from and consequently the last part of the grass seed sown has a greater percentage of Clover than the first.

Lb. \$2.25

WILD WHITE CLOVER

Dwarf growing, thick White Clover which is more vigorous than the ordinary White Clover, and excellent for lawns. One pound will cover about 800 square feet.

Lb. \$2.85

KENNEDY'S PASTURE MIXTURE

For Permanent Pasture and Hay Crops

Our Permanent Pasture Grass Seed Mixtures contain only grasses most suitable for this purpose. The result of sowing Kennedy's Permanent Pasture Mixture is a successive growth of rich, succulent grasses from early spring until late fall.

We recommend, in good soil, sowing 80 lbs. per acre or in poor soil 100 lbs. per acre. We also suggest sowing an additional 10 lbs. of Red Clover, in either case, to the acre.

When ordering state whether your soil is sand, clay, moist or dry so that the proper proportions of the various grasses may be used.

A—For Light Soil. Sow 100 lbs. per acre.

B—For Wet, Heavy Soil. Sow 100 lbs. per acre.

Kennedy Quality Pot-Grown Strawberry Plants

Plants ready for shipment April 1 to May 15 and August 1 to late Fall.

There are many reasons for starting your Strawberry bed with pot-grown plants. They are established growing plants and their growth is not interrupted or retarded by transplanting, thus there is no loss of plants. They can be cultivated as soon as set out and kept growing. In planting pot-grown plants, a full crop is assured for next summer. Plant in rows two feet apart, twelve inches apart in the row.

Strawberries can be grown in almost any soil or climate, from Florida to Canada, that will grow other crops; they are not fussy about types of soil, but like all other crops they will do better in well drained soil which will retain moisture and of good fertility. In planting be sure to firm the soil well around the plants and do not cultivate or hoe too deeply as too deep cultivation cuts the roots and loosens the soil improperly for root growth. Moisture is an essential requirement after the fruit is formed and during fruiting time.

In preparing the bed, when barnyard manure is not easily obtained, a complete fertilizer should be worked well into the soil at the rate of fifteen pounds per one thousand square feet of bed. Do not allow the plants to come in contact with the fertilizer, as it is likely to kill or scorch them. Another application of fertilizer, at the same rate as used in preparing the bed, should be applied again along the rows of plants very early in the spring before growth starts. All fertilizer should be carefully brushed off the leaves immediately after applying and never use fertilizer when the plants are wet. Unless soil is very acid, lime should not be used.

After heavy frost, usually in December in the vicinity of New York, apply a light mulch of salt hay or other similar material to prevent alternate freezing and thawing. When growth starts in spring, the salt hay should be arranged between the rows. This keeps the fruit clean, prevents the growth of weeds, and retains moisture which is very necessary during the fruiting season.
